

What tools did you use to develop this web site?

This web site was developed with the following tools:

- Linux - operating system.
- Apache - web server.
- MySQL - database.

- PHP - for server-side scripting.
- Joomla - content management system.

- GIMP - for image editing. All of these (except GIMP which is not on the server) are hosted by SiteGround. They provide exceptional service at a great (i.e. low) price. As you can see, I'm trying to keep costs down. However, I also choose to use these tools for their exceptional reliability and performance.
